

AI-Based Stock News Sentiment Tracker

Name: Mahdi Mohammadkhani

Course: ITAI 2 3 7 2

Date: 0 2 / 2 4 / 2 6

Problem

Investors need to react quickly to market news to make informed decisions. However, reading hundreds of articles every day is impossible. An AI-based sentiment tracker can automatically analyze financial news and provide daily insights per stock.

Crawler Task

The crawler collects data from financial news websites such as Yahoo Finance, Reuters, and CNBC. It extracts headlines and full article text for selected companies and filters relevant articles for each stock.

Example stocks: MSFT, GOOGL, AAPL, TSLA, META

AI Task

Once the news data is collected, an AI model performs the following tasks:
Sentiment Analysis – Determines whether the news is positive, negative, or neutral.
Keyword Extraction – Identifies the keywords that are driving the sentiment.
Trend Analysis – Tracks changes in sentiment over time for each stock.

Example Gen AI Tools: OpenAI GPT model for sentiment classification and keyword extraction, or a custom fine-tuned model such as Hugging Face Transformers.

Output

The system generates daily reports for each stock, including:
Daily Sentiment Score e.g., "MSFT: Positive" or "TSLA: Negative."
Insights per Stock e.g., "Stock AAPL sentiment turned negative after quarterly earnings announcement."
Keyword Summary – Key terms driving the sentiment, like "earnings," "lawsuit," or "launch."

This allows investors to quickly understand market sentiment without reading every article.

Conclusion

By combining a web crawler with AI-based sentiment analysis, the Stock News Sentiment Tracker can help investors save time, reduce information overload, and provide actionable insights for investors. Using Gen AI tools

GPT or BERT, this system can process large volumes of financial news and generate clear daily for multiple stocks, helping investors make informed decisions faster.
